

TOXIVEN BIOTECH PRIVATE LIMITED

Target: Cardiovascular –coagulation, blood pressure, haemorrhage

Format: Targeted Venom Discovery Array

Code: T-VDA^{CV}

Product Description

Venoms are a proven therapeutic resource with several drugs on the market in cardiovascular biology such as anticoagulants and **antihypertensives**. Snake venoms are a rich source of new cardiovascular tools such as C-type lectins, serine proteases, **natriuretics** and a wealth of signalling peptides. These targeted arrays contain pure venom fractions from 12, 24, 48 or 96 species **optimised for identification of novel tools**. Each array contains characterised venoms active in analgesic pathways from the literature to act as positive controls. The control venoms for T-VDA^{CV} include *Crotalus adamanteus* (eastern diamondback rattlesnake) where several **bradykinin potentiating peptides** have been discovered¹; *Dendroaspis angusticeps* (eastern green mamba) where several **novel natriuretic peptides** have been discovered²; and *Bitis gabonica* (Gaboon viper) venom which contains a large abundance of serine proteases and, in particular, rhinocerase³. Other venom fractions making up the library have been specially selected by our drug discovery scientists to maximise novel hit potential.

- Venoms are supplied lyophilised in Echo® qualified acoustic source plates (Labcyte Inc) and are useable on any SBS footprint liquid handling device or by hand.
- 384-well format has 200ng venom fraction per well, suggested dilution 20µl as hit fractions are typically active at 5µg/ml and below.
- 1536-well format also available.
